What's Included in our Site Scanner Basic Plan

The Basic Site Scanner includes many functionalities that will detect and warn you about malware at an early stage, but now we've added a brand new feature that will allow you to minimize any damage in case of an attack, and further protect your website.

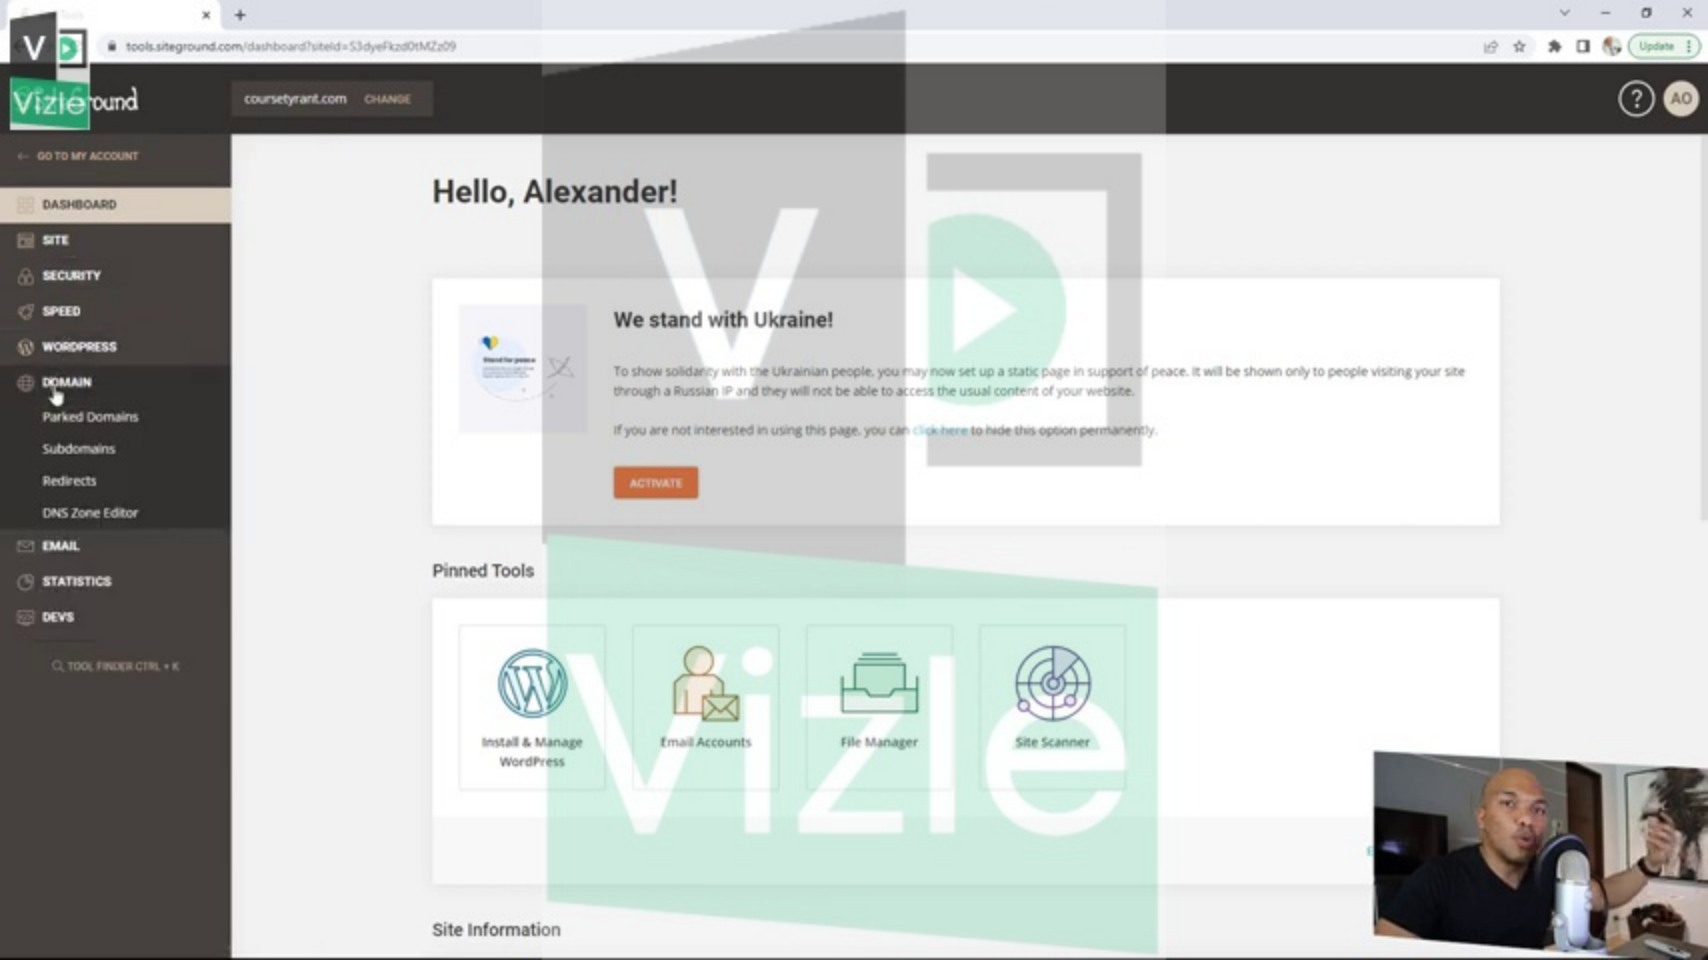

NEW FEATURE: Site protect

If you get a malware notification or you suspect that your website was compromised, you can now manage four different on/off options from the Site protect interface. They allow you to temporarily disable all file uploads to your website by three different methods: disabling FTP and/or SSH transfers, and disabling file upload via PHP. The fourth on/off option prevents the execution of malicious scripts on the server. While any of these options are enabled, you can safely review the site status and ensure that no additional threats can reach it. This gives you some time to assess the situation, take action to clean any malicious code on your site, and minimize the damage. Once you are sure that your site is safe, you can switch off the respective option from the Site protect interface and resume file uploads again.

URLs scan

The automatic URLs scan crawls your website URLs every day and checks if there is publicly detectable malware on your website.

Hello, Alexander!

We stand with Ukraine!

To show solidarity with the Ukrainian people, you may now set up a static page in support of peace. It will be shown only to people visiting your site through a Russian IP and they will not be able to access the usual content of your website.

If you are not interested in using this page, you can [click here](#) to hide this option permanently.
